Project focus

Implement Client Script & UI Policy

Selected problem

ServiceNow users can experience confusing or inefficient form entry when field visibility, mandatory status, or validation does not reflect the current record context.

Goal

Design a clear, maintainable client-side form experience that supports accurate data entry.

Team discussion prompts

Which fields depend on other selections? What should users see first? Which rules are simple conditions, and which require scripted logic?

Guiding principle

Prefer the simplest supported configuration; keep server-side validation for authoritative data integrity and security.

Brainstorm & Idea Prioritization

Form guidance

Show or hide dependent fields; make relevant fields mandatory; make calculated or controlled fields read-only; add short instructions near confusing inputs.

Validation and feedback

Validate values on change or before submission when appropriate; show actionable messages; avoid duplicate or contradictory alerts.

Implementation ideas

Use UI Policies for condition-based field states; use onChange Client Scripts for reactions to a field changing; use onSubmit scripts for client-side checks before submission.

Quality ideas

Name rules consistently; document conditions; test true/false transitions; test empty values and unusual combinations; review for conflicts between policies and scripts.

Grouped concepts

A. Conditional form layout. B. Input validation and guidance. C. Maintainability and testing.

Brainstorm & Idea Prioritization

Page 3 — Prioritization and action plan

Team ID: BDU463SWTID-2026-8770 | Project: Implement Client Script & UI Policy

Prioritization criteria

User impact, implementation effort, maintainability, and risk of conflicting behavior.

First to implement

Start with the highest-value, low-complexity UI Policies for visibility, mandatory, and read-only states.

Next

Add only the Client Scripts needed for interactions or validation that cannot be handled cleanly with declarative policies.

Test plan

Check each condition when it is true and false; change values repeatedly; test blank and unexpected inputs; confirm messages are clear; verify server-side rules still protect data.

Deliverables

Configured UI Policies and Client Scripts; condition/rule inventory; test cases and results; brief administrator handover notes.

Decision record

Review the proposed rules with the process owner before implementation and confirm behavior in the target instance.
