

Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Field	Value
Team ID	BDU463SWTID-2026-8770
Project Name	Implement Client Script & UI Policy
Date	01 October 2026

Project Objective

Improve the ServiceNow Incident form using Client Scripts and UI Policies for dynamic field behaviour, client-side validation, and consistent data entry.

Functional Requirements

FR No.	Functional Requirement	Sub Requirement / Story
FR-1	Dynamic Form Behaviour	Control Incident form behaviour during load, change and submit events.
FR-2	Field Visibility	Show or hide relevant fields based on defined conditions.
FR-3	Mandatory Fields	Make selected fields mandatory when a condition requires them.
FR-4	Read-only Fields	Prevent editing of selected fields when a condition requires it.
FR-5	Client Validation	Validate required values before submission.
FR-6	User Guidance	Display clear messages when input is invalid.

Primary Features

- Client Scripts
- UI Policies
- UI Policy Actions
- GlideForm (g_form)
- Incident form and Incident table

Detailed Functional Requirements

The Incident form should respond immediately to user actions and apply the configured field behaviour without unnecessary manual steps.

Requirement	Expected Behaviour	Implementation
OnLoad	Prepare the initial form state when the Incident form opens.	onLoad Client Script / UI Policy
OnChange	Update dependent behaviour when a relevant value changes.	onChange Client Script / UI Policy
OnSubmit	Check required conditions before saving.	onSubmit Client Script
Conditional visibility	Display or hide a field according to a condition.	UI Policy + Action
Conditional mandatory	Make a field mandatory only when required.	UI Policy + Action
Conditional read-only	Make a field non-editable when required.	UI Policy + Action
Validation message	Guide the user when input is invalid.	Client Script / GlideForm

Client Script Requirements

- Use onLoad for initial client-side setup.
- Use onChange for dependent field behaviour.
- Use onSubmit for pre-submission validation.
- Use GlideForm methods to read and control fields.
- Keep logic focused on Incident form behaviour.

UI Policy Requirements

- Define a clear condition for each policy.
- Use UI Policy Actions for field-level states.
- Configure visible, mandatory and read-only outcomes.
- Test both true and false conditions.

Non-functional Requirements

The solution should provide predictable, maintainable and responsive Incident form behaviour while keeping the implementation focused on ServiceNow client-side configuration.

NFR No.	Requirement	Description
NFR-1	Usability	Provide clear field behaviour and immediate user guidance.
NFR-2	Security	Client-side controls do not replace ServiceNow authorization and access controls.
NFR-3	Reliability	Scripts and policies should work consistently for defined conditions.
NFR-4	Performance	Client logic should be lightweight and avoid repeated processing.
NFR-5	Maintainability	Scripts, conditions and actions should be clearly named and documented.
NFR-6	Compatibility	Configuration should work with the targeted ServiceNow Incident form.

Acceptance Criteria

- Initial Incident form state is correct.
- Relevant field changes update dependent behaviour.
- Invalid submissions are prevented.
- Fields change visibility, mandatory and read-only state only when required.
- Valid Incident data can be submitted.
- Positive and negative conditions are tested.

Expected Outcome

The implementation provides structured Incident data entry by combining Client Scripts for dynamic logic and validation with UI Policies for condition-based field control.
