

Project Design Phase-II

Technology Stack (Architecture & Stack)

Field	Value
Team ID	BDU463SWTID-2026-8770
Project Name	Implement Client Script & UI Policy
Date	01 October 2026

Technical Architecture

The solution operates inside the ServiceNow platform and focuses on the Incident form. Users interact with the form; UI Policies and Client Scripts control dynamic behaviour; GlideForm APIs provide client-side field interaction.

Architecture Flow: User → ServiceNow Incident Form → UI Policies / Client Scripts → GlideForm APIs → Incident Record

Architecture Components

Component	Role	Technology
User Interface	Incident creation and update screen.	ServiceNow Incident Form
Client-side Logic	Dynamic behaviour and validation.	JavaScript Client Scripts
Conditional Control	Field visibility, mandatory and read-only states.	UI Policies
Field Actions	Applies field-level states.	UI Policy Actions
Client API	Reads and controls current form fields.	GlideForm (g_form)
Data Record	Stores Incident information.	ServiceNow Incident Table

Process Flow

- User opens or edits an Incident.
- UI Policies evaluate conditions.
- Client Scripts respond to load, change or submit.
- GlideForm applies required field behaviour.
- Submission occurs when defined validation rules are satisfied.

Table-1: Components & Technologies

S.No	Component	Description	Technology
1	User Interface	Incident form used by ServiceNow users.	ServiceNow Incident Form
2	Application Logic-1	Initial form behaviour.	onLoad Client Script
3	Application Logic-2	Responds to a field value change.	onChange Client Script
4	Application Logic-3	Validates data before submission.	onSubmit Client Script
5	Application Logic-4	Condition-based field control.	UI Policy
6	Application Logic-5	Applies field states.	UI Policy Action
7	Client API	Client-side field interaction.	GlideForm (g_form)
8	Data Storage	Stores submitted Incident records.	ServiceNow Incident Table
9	Platform	Hosts project configuration.	ServiceNow Platform
10	Scripting	Language for Client Scripts.	JavaScript

Implementation Guidelines

- Keep Client Scripts specific to the Incident form.
- Use UI Policies for condition-based field-state changes.
- Use UI Policy Actions for field-level outcomes.
- Use GlideForm only for required client-side operations.
- Use clear names and descriptions.

Data & Interface

No external API, separate machine-learning model, or independent database is required for this project. The Incident form and Incident table are the main interface and data components.

Table-2: Application Characteristics

S.No	Characteristic	Description	Technology
1	Open-Source Frameworks	No separate framework is required for the requested configuration.	ServiceNow configuration
2	Security	Client validation complements, but does not replace, access controls.	ServiceNow roles / ACLs
3	Scalable Architecture	Configuration is maintained centrally within the ServiceNow platform.	ServiceNow configuration
4	Availability	Configured form behaviour is delivered through the ServiceNow instance.	ServiceNow Platform
5	Performance	Scripts remain small and avoid unnecessary repeated processing.	JavaScript / GlideForm
6	Maintainability	Clear names, conditions and descriptions support maintenance.	ServiceNow configuration

Technology Responsibilities

- Client Scripts: dynamic logic and validation.
- UI Policies: condition-based form state.
- UI Policy Actions: field-level state changes.
- GlideForm: client-side field interaction.
- JavaScript: Client Script language.
- Incident Table: project data record.

Architecture Summary

The architecture keeps the requested functionality close to the Incident form. UI Policies handle declarative field-state changes, while Client Scripts handle dynamic logic and validation.
